SHIMSEN QuEChERS Product Guidebook

CoreFocus

SHIMSEN QuEChERS

A brief overview of the method of QuEChERS-method

- QuEChERS (Quick, Easy, Cheap, Effective, Rugged and Safe) was originally proposed by the US Department of Agriculture as a sample preparation method in 2003.
- It has been applied to a variety of sample preparations, especially for pesticide residue pretreatment.
- It's simpler, more economical, and faster than traditional methods.

Principle of EN 15662

The homogeneous sample is extracted with the help of acetonitrile. Samples with low water content (< 80 %) require the addition of water before the initial extraction to get a total of approximately 10 g of water. After addition of magnesium sulfate, sodium chloride and buffering citrate salts, the mixture is shaken intensively and centrifuged for phase separation. An aliquot of the organic phase is cleaned-up by dispersive solid phase extraction (D-SPE) employing bulk sorbents as well as magnesium sulfate for the removal of residual water. Following clean-up with amino-sorbents (e.g. primary secondary amin sorbent, PSA) extracts are acidified by adding a small amount of formic acid, to improve the storage stability of certain base-sensitive pesticides. The final extract can be directly employed for GC- and LC-based determinative analysis. Quantification is performed using an internal standard, which is added to the extract after the initial addition of acetonitrile.

Principle of AOAC 2007.01

The QuEChERS (quick, easy, cheap, effective, rugged, and safe) method uses a single-step buffered acetonitrile (MeCN) extraction and salting out liquid-liquid partitioning from the water in the sample with MgSO_4 . Dispersive-solid-phase extraction (dispersive-SPE) cleanup is done to remove organic acids, excess water, and other components with a combination of primary secondary amine (PSA) sorbent and MgSO_4 ; then the extracts are analyzed by mass spectrometry (MS) techniques after a chromatographic analytical separation.

The **Procedure** of QuEChERS-method

AOAC 2007.01 Method

Weigh 15g Homogenized sample,
then add 15mL acetonitrile with 1% Acetic acid (V/V) ,
6g MgSO₄+1.5g NaOAc+ Internal standards solution.

Shake or Vortex vigorously for 1min,
centrifuge > 1500x g, 1min.

Transfer 1mL or 8mL Supernatant to the dSPE Tube
depending on the dSPE specification.
Shake or Vortex vigorously for 1min, and then
centrifuge > 1500x g, 1min.

EN 15662 Method

Weigh 10g Homogenized sample ^①,
then add 10mL acetonitrile and internal standards.
Shake or Vortex vigorously for 1min.
(If the sample's water content is <80%,
water must be added after
Homogenization, please see the following
EN15662:2008 (E) 5.2 ^②)

Add extraction salts (4g MgSO₄, 1g NaCl, 1g
TSCD, 0.5g DHS) into the above sample extraction
solution. Shake or vortex vigorously for 1min, and
then centrifuge > 3000x g, 5min.

Transfer 1mL or 6mL Supernatant to the dSPE
Tube depending on the dSPE specification. Shake
or Vortex vigorously for 1min,
and then centrifuge > 3000x g, 5min.

**Dilute, solvent exchange or evaporate as necessary for
GC/MS-MS or LC/MS-MS Analysis**

① The sample size depends on the sample matrix: Fruit and vegetable samples, sampled at 10g ± 0.1g; Grain and honey samples, sampled at 5g ± 0.05g; Tea and spices, sampled at 2g ± 0.03g.

② If the water content of the sample is <80%, a sufficient amount of cold water (<4 °C) needs to be added before the sample is homogenized. The water content of common samples and the amount of water that needs to be added, Please refer to EN15662:2008(E)5.2

③ TSCD-sodium citrate, DHS-disodium hydrogen citrate

According to EN 15662: 2008

1

Accurately weigh the right amount of homogeneous sample

2

Add extraction solvent and internal standard solution, shake vigorously

3

Add SHIMSEN QuEChERS extraction salt pack, shake vigorously, centrifuge, Layering

4

Transfer the supernatant to the SHIMSEN QuEChERS dSPE purification tube, shake vigorously, centrifuge

Selection guide of d-SPE

Ceramic homogenizer & Centrifuge tube

Code Number	Product Name	package
380-00169	Ceramic homogenizer, Compatible with 2 mL dSPE purification tube	100/p
380-00170	Ceramic homogenizer, Compatible with 15 mL dSPE purification tube	100/p
380-00171	Ceramic homogenizer, Compatible with 50 mL extraction tube	100/p
380-00163-05	SHIMSEN QuEChERS III, 15mL, PP Centrifuge Tube	50/p
380-00163-06	SHIMSEN QuEChERS III, 50mL, PP Centrifuge Tube	50/p

Supplementary explanation 1:

PSA is mainly used to remove impurities such as sugars, fatty acids, organic acids and anthocyanins in the sample matrix;

C18 is mainly used to remove lipids and non-polar interference substances in the sample matrix;

GCB (carbon black) is mainly used to remove pigments, sterols, non-polar substances;

Supplementary explanation 2:

2mL purification tube is suitable for transferring 1mL extraction solution;

15mL purification tube is suitable for transferring 6-8mL extraction solution;

Supplementary explanation 3:

Functions of Ceramic homogenizer

1. Excess anhydrous MgSO₄ needs to be added during the extraction and purification process. The ceramic protons can effectively prevent excessive salt agglomeration.

2. During oscillation and centrifugation, the ceramic homogenizer accelerates the diffusion of the adsorbent for better extraction of the purified sample
